The Problem

You are an estate agent and you are looking for a residential property in Swellendam for clients who have the following criteria:

1. It needs to be in Swellendam
2. Closer than 1200m distance of a school
3. It must be more or equal than 200m squared in size
4. Closer than 40m to a main road
5. Closer than 500m to a “Powell House Restaurant” restaurant

Perform a vector analysis of the data to identify the properties that meet the above criteria.

✓ Advice:

- To filter the **restaurants** layer to show only the restaurant named **Powell House Restaurant**, use this **Filter Expression**:

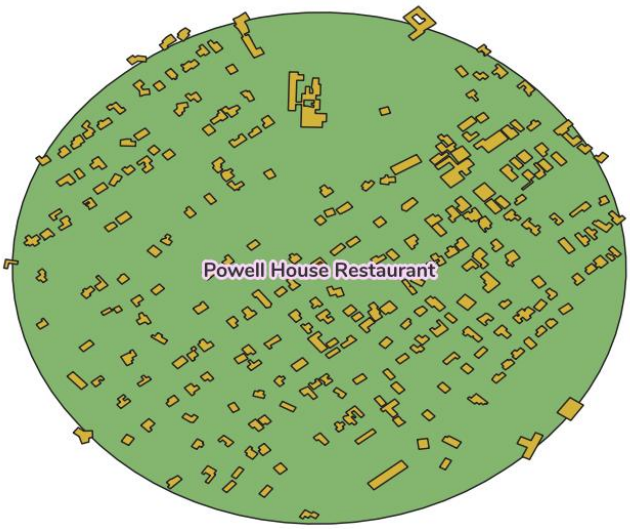
  "name" = 'Powell House Restaurant'

- To filter the **roads** layer to show only the main road, use this **Filter Expression**:

  "highway" NOT IN ('footway', 'path', 'unclassified', 'track') AND "highway" IS NOT NULL

- Don’t forget to convert the coordinate reference system (CRS) of the layers to **WGS 84 / UTM zone 34S** so that the layers are ready for measurement and analysis. Save these layers inside the **vector_analysis.gpkg** database located at: **C:\QGIS-Training-Data-release_3.16\exercise_data\vector_analysis.gpkg.**

✓ Hint

- You will go through this stage during the implementation:


- The final result:
